

Module 6 Assignment: AI Interaction Audit & Ethical Reflection

Part 1: Seven-Day AI Log

Date	System Name	Type of Interaction	Outcome
Daily	Alexa	Physical - Disabled wake-up alarm using a voice command.	Able to disable alarm verbally without having to find the off button in the dark.
Daily	Alexa	Physical – Verbal request for morning news brief.	Received a 4-5 minute summary of daily news, finance, traffic, etc.
Daily	Alexa	Physical – Verbal request for the next day's weather conditions.	Made aware of whether a jacket was needed because of temperature or rain likelihood.
Daily	Amazon Prime	Passive – Automatic workout music selection.	Requested 30 minutes of workout music based on previous preferences.
Daily	Google Gemini	Professional – Checked personal emails and homework for grammar and spelling.	A more comprehensive grammar check than MS Word performs by itself allows for a quick check of my writing.
Every Workday	Microsoft Copilot VS Code Plugin	Direct – AI agent development.	Used AI plugin to assist with development and debugging of an AI agent and other code.
Every Workday	Microsoft Teams Copilot plugin	Passive - Automatic transcription of multiple Teams meetings.	Generated meeting notes for attendees unable to attend and executive summaries.
Every Workday	Microsoft Outlook plugin	Professional – Spelling and grammar check, along with suggestions for improving work email.	More concise emails written quickly. Less time spent proofreading my hasty typing.
Every Workday	Google Gemini	Direct – Checked personal emails and homework for grammar and spelling.	A more comprehensive grammar check than MS Word performs by itself allows for a quick check of my writing.
9/20	Microsoft Copilot	Professional – Asked for help proofreading a talk that would be given that afternoon on caring for the poor and	Adjusted text to be more easily understood when spoken to a group whose first language is not English. Identified portions of text

		responsible use of donated funds.	that could be skipped if time was limited.
9/20	Google Gemini	Direct – Asked for ways to adjust a cheesecake recipe when missing an ingredient.	The cheesecake was still delicious, though a little softer than desired.
9/20	Google Search	Direct – Reviewed personalized search results, suggested content, or ranked online information.	Found relevant information faster despite a misspelling.
9/20	Netflix	Passive - Viewed AI-generated recommendations based on past behavior or preferences.	Found an interesting period drama to watch based on previously rated shows and watch patterns.
9/21	Microsoft Copilot	Professional - Asked for help annotating AI governance documentation used in my role at work.	Produced clearer, more concise content with automatic references for internal customer use.
9/21	Microsoft Copilot	Direct – Asked for a summary of governance and compliance content for a vendor wishing to be considered.	Clearly identified the vendor’s lack of required compliance status, avoiding a pointless sales demo.
9/21	LinkedIn Feed	Passive - Random how-to videos that were clearly AI-generated and not very good.	Some amusement but mostly wasted time.
9/21	Netflix	Passive - Viewed AI-generated recommendations based on past behavior or preferences.	Found an interesting film noir and added it to favorites for later.
9/22	LinkedIn Feed	Direct - Searched for information on career training.	Found recommended Google Cloud training that could be relevant for learning AI.
9/23	Microsoft Copilot	Direct - Asked for a summary of governance and compliance content for a vendor wishing to be considered.	Identified potential compliance status. Scheduled demo.
9/23	Netflix	Passive - Viewed AI-generated recommendations based on past behavior or preferences	Found a binge-worthy show for after Eastern Fall 1 classes completed and added to favorites for later.
9/23	Google Search	Direct - Searched for information on AI Guardian Agent Boundary .md files.	Found information relevant to AI agent security component being considered for work.
9/24	Amazon Prime	Passive - Viewed AI-generated recommendations based on past behavior or preferences.	Found interesting period piece, but it requires payment (maybe later).
9/24	Google Search	Direct - Searched for information on AI Guardian Agent Boundary .md files.	Found information relevant to AI agent security component being considered for work.

9/25	LinkedIn Feed	Professional - Found an interesting job. Used resume assessment tool.	Received good feedback on how to improve my resume for the position.
9/25	Amazon Prime	Passive - Viewed Prime Day recommendations.	Added items to the cart for later.
9/26	Microsoft Copilot	Direct - Asked for an outline for a 20-minute talk that would be given the next day on repentance and personal worth.	Generated an outline. It's a place to start, but most of it gets changed during the talk-writing process.
9/26	Google Search	Direct - Searched for information useful for the talk.	Found some good stories and inspirational quotes.
9/26	Google Map GPS	Physical - Asked for directions to a restaurant and theater.	Able to avoid a traffic slowdown due to an accident. Arrived on time.

Part 3: Ethical Reflection

Data Origin and Privacy

Three different systems will be considered: Google Gemini, Microsoft Copilot, and Amazon Alexa.

Google Gemini has access to some personal data if I am logged into my Google account. When I'm not logged in, Gemini still has GPS coordinate access and travel history. In addition to this information, Gemini has access to search data whether I am logged in or not, but the historical searches do not seem to be retained if I am not logged in. I suspect Gemini has more information since Gemini will occasionally make purchase recommendations through Maps based on my location that seem related to my previous purchases, whether I am logged into my account or not. My consent was explicitly given when logged into my account and implied when using Gemini otherwise.

Microsoft Copilot is a tool I use for work. Copilot has access to my personal information, and a whole lot of company data that was ingested as part of the enterprise development, but contracts with Microsoft restrict information from leaving my employer's network boundary. I don't believe Microsoft has direct access to my personal information other than the required email address, and my name which is saved with the account. My consent was given to my company. I don't believe I provided any consent directly to Microsoft, other than my implied consent because I chose to remain with my employer.

Amazon Alexa is connected to my Amazon Prime account, so it knows my personal information, purchasing history, and can execute purchases on my behalf if I enable that feature, which I won't. My explicit consent was given for this. Implicitly, Alexa knows that there are other individuals in the household and has asked to associate voices with a name. This feature has since been disabled. I don't want Alexa to know my kids' names. What is somewhat concerning is that Alexa can hear conversations throughout the house, and it is not clear how many are retained. I like the convenience of Alexa and get a lot of use out of it, but this class has shown me that maybe Alexa knows much more about me than I want it to, consensual or otherwise. Other than the information stored with my Amazon account, the

data Alexa has access to is granted implicit consent by the use of the “Alexa” wake word, or no consent is given because Alexa is always listening even when it is not the intended recipient of the data.

Human Agency

AI increased productivity by removing some of the mundane tasks, such as sifting through mountains of spammy email, and improving my writing. I think AI did influence behavior to a degree. I have noticed that I do not respond to as many people as I used to. Because AI is classifying more emails as not requiring a response from me, I have fewer conversations with people than I used to. These conversations are important in building trust with different teams, but they happen less, because emails that would have triggered an unrelated conversation now go unseen. I feel less in control because AI is hiding some stuff from me, but I’m also more focused on things that matter. I’m not a very creative person, so AI’s participation in daily tasks does provide a way for more creativity to be part of my daily work.

Reflection on AI Opt-Out

The recurring periods identified that I chose to go AI-free were my morning exercise routines, and weekend cooking.

Morning Exercise

I often let AI choose what music I listen to while traveling to the gym, during my workout, and while traveling home. I opted out of AI this week by choosing to listen to the radio while traveling to and from the gym and doing a Sudoku while exercising on an elliptical. Listening to the radio instead of having AI-selected music had mostly negative results. The radio provided traffic information that was useful in explaining why there was uncharacteristically heavy traffic, but it also came with commercials and music I didn’t like that much. I live near Washington, D.C., so political ads are frequent and very annoying, especially since I do not live in a competitive district, so the ads usually are not for any individual I would be able to vote for even if I wanted to. I think a more positive outcome would have been to listen to a CD of my favorite artist, but I didn’t have one in the car at the time. Doing a Sudoku instead of listening to an AI-curated music playlist was an interesting change. It caused my mind to be focused during my workout rather than letting it wander. I think there are times when exercising with a focused mind would be good to start the day, but not always.

Weekend Cooking

I cook on weekends because I enjoy cooking and my wife appreciates the break. Normally, I use Google Gemini to search for or build a recipe, especially when we don’t have a specific ingredient. I also use Amazon Alexa for simple measurement conversions when doing things like doubling or tripling a recipe for large groups. For the AI Opt-Out, I chose to use a physical recipe book instead. The physical recipe book worked, but it was much less convenient. It required that I search through multiple recipe books to collect all the different recipes needed for the meal. I didn’t have to do any measurement conversions, but it would not be difficult, since most cookbooks have a specific section for this that is easily found. For retrieving and/or modifying recipes, AI is much more flexible and requires less time. For cooking, I prefer to use AI, and it isn’t close.

Word Counts

Part 1: 757

Part 3: 953
